World-leading security delivered

High profile access control identity credentials for the summit and delegates secured by Ultra ID, Magicard.

Toluca, México - Together for just eight hours, United States President Barack Obama and Canadian Prime Minister Stephen Harper joined President Peña Nieto of México on February 19th for the 2014 North American Leaders' Summit. Sensitive political issues including NAFTA, immigration reform and major oil pipelines between the US and Canada were on the table for this one-day meeting.

A forty minute drive from the Distrito Federal, Toluca is a state capital of 800,000 people - a world away from the crime and bustle of México City and its 8.8 million residents. But with the three leaders of North America present, security was tight for the summit. A veteran provider of security and access control at high-profile events in México, the efforts of security firm Técnica Comercial Vilsa (T.C. Vilsa) were instrumental in providing the highest level of security for the meeting.

“

The combination of security equipment and an expert, high performance team achieved in fulfilling the mission assigned for the event in record time.

”

Luis Vidales, managing director: T.C. Vilsa

Using technology card issuance equipment provided by UK manufacturer Ultra ID, T.C. Vilsa was able to rapidly issue secure identity credentials for the summit's staff and guests. Patented and proprietary technologies including HoloKote™ and Kinegram® imprinting ensured visual and digital security for access control.

With so much on the line, T.C. Vilsa managing director Luis Vidales was pleased with the results: “The combination of security equipment and an expert, high performance team achieved in fulfilling the mission assigned for the event in record time.”

Integration, reliability and success in high-stakes assignments are not new achievements for Ultra ID. As part of the internationally successful Ultra Electronics Group, Ultra ID and its products are trusted by organisations and governments throughout the world to issue millions of secure identity credentials.
